

LIST OF CURRENT CLAIMS

1. (Currently Amended) A supporting device for supporting insertion of a medical instrument into a human body, comprising:

a tubular member having an inner passageway between its opposite ends through which the medical instrument is capable of passing[[:]], wherein the tubular member is configured to guide the medical instrument into a digestive organ from an oral cavity through a pharynx, the tubular member is formed in a curved shape in advance to conform to the shape of pharynx, and the tubular member has a diameter that is larger than that of the pharynx to allow an expansion of the pharynx; and

a reinforcement member formed by a thin plate extending along a perimeter of the inner passageway,

wherein ~~the tubular member and~~ the reinforcement element ~~have~~ has curved shapes conformable to the shape of a pharynx of a human body and, when inserted from an oral cavity into the pharynx and retained there, the tubular member and the reinforcement element guide the medical instrument to [[a]] the digestive organ through the inner passageway.

2. (Currently Amended) A supporting device for supporting insertion of a medical instrument into a human body, comprising:

a tubular member having an inner passageway between its opposite ends through which the medical instrument is capable of passing[[:]], wherein the tubular member is configured to guide the medical instrument into a digestive organ from an oral cavity through a pharynx, and the tubular member has a diameter that is larger than that of the pharynx to allow an expansion of the pharynx;

a reinforcement member extending along a perimeter of the inner passageway; and

a guiding member having a diameter smaller than the inner passageway and insertable from [[an]] the oral cavity of a human body into [[a]] the pharynx, wherein the guiding member is inserted from the oral cavity into the pharynx prior to an insertion of the tubular member, and the guiding member guiding, when inserted into the pharynx, the tubular member and the reinforcement member from the oral cavity to the pharynx,

wherein, when guided to the pharynx and retained there, the tubular member and the reinforcement member guide the medical instrument to a digestive organ through the inner passageway.

3. (Original) The supporting device of claim 1, further comprising a guiding member having a diameter smaller than the inner passageway of the tubular member and insertable from the oral cavity into the pharynx wherein, when inserted into the pharynx, the guiding member guides the tubular member and the reinforcement member from the oral cavity to the pharynx.

4. (Previously Presented) The supporting device of claim 1, wherein the reinforcement member has the shape of a spiral continuously extending in a center line direction of the inner passageway.

5. (Previously Presented) The supporting device of claim 1, wherein a digestive organ end of the tubular member extends toward a digestive organ ahead of a digestive organ end of the reinforcement member.

6. (Previously Presented) The supporting device of claim 1, wherein the digestive organ end of the tubular member is slanted with respect to the center line of the inner passageway.

7. (Previously Presented) The supporting device of claim 1, wherein the tubular member is molded with the reinforcement member buried therein.

8. (Previously Presented) The supporting device of claim 2, wherein:
the guiding member includes a guiding member engagement section; and

the tubular member includes a tubular member engagement section for engaging with the guiding member engagement section of the guiding member inserted up to a predetermined position in the inner passageway of the tubular member.

9. (Previously Presented) The supporting device of claim 2, wherein:

the guiding member has a guiding member alignment mark; and

the tubular member has a tubular member alignment mark aligned with the guiding member alignment mark of the guiding member inserted to a predetermined position in the inner passageway of the tubular member.

10. (Currently Amended) The supporting device of claim ~~[[1]]~~ 3, wherein:

the tubular member is made of a resin material; and

the guiding member is made of another resin material harder than the resin material of the tubular member.
